

In Week 4, I learned how to use JavaScript to add interactive features to my webpage, which was an extension of our previous CSS activity. This activity was a little more challenging for me, especially when adding the something like a real-time clock and organizing the input fields in the contact form. I had some difficulties understanding how certain parts of the code worked, so I used AI to help me understand the code and make some customizations. By following the explanations and trying the changes, I was able to overcome these difficulties and make the webpage work as expected. One improvement I made was adding a real-time clock and a theme switcher to make the webpage more interactive. Overall, this activity helped me understand how JavaScript works with HTML and CSS, and I learned that asking for help and practicing are important when dealing with unfamiliar code.
