

I learned how to integrate APIs and use local storage to create a website with different features. This was one of the hardest weeks for me because customizing the code was difficult, especially without a demo or guide from our professor, so I had to rely on the knowledge I gained from previous weeks. One of my biggest challenges was linking the CSS file to all the HTML files and organizing everything into one complete website. I overcame these problems after many attempts, checking my code and making changes until it worked properly. To be honest, the website I am submitting is not my original work because I accidentally deleted the first one, so I put all my effort into recreating it to have something to push to GitHub. One improvement I made was creating a consistent layout and design across all the pages to make the website look more organized. Overall, this week was very challenging, but it taught me to be more patient, resourceful, and persistent when working on web development projects.
