

In Week 5, I learned how to use Bootstrap to improve the design and layout of my webpage. This activity was more difficult than the previous ones because customizing the different parts of the website took time and effort. I also had trouble remembering where I placed certain codes in the HTML, CSS, and JavaScript files, so there were some unnecessary parts that I forgot to remove. Another challenge I encountered was adding the dark and light modes using a specific keyboard key, and I am still not sure if this feature is working properly. Despite these difficulties, I was able to finish the activity by checking my code and making changes until I got the results I wanted. One improvement I made was customizing the profile section, adding images, and updating the footer and social media section to make the webpage more personalized. Overall, this activity was challenging, but it helped me improve my web customization skills and understand the importance of keeping my code organized.
