

Through this laboratory activity, I learned how to create a basic HTML webpage using HTML elements such as headings and paragraphs. I also learned how to write and organize HTML code in Visual Studio Code and test my webpage using Live Server. At first, I had some difficulties figuring out how to use the HTML Snippets feature in VS Code. I thought that the feature was no longer available, so I spent some time trying to understand how to create the basic structure of an HTML document. I also had other schoolwork to finish, which caused me to complete the activity later than expected.

As I continued working on the activity, I discovered that I could use the built-in Emmet feature in VS Code to generate the basic HTML structure more easily. After learning how it worked, I was able to write my code and display the correct output in my browser. I learned the importance of using proper HTML tags, such as heading tags for titles and paragraph tags for text. I also understood that HTML serves as the foundation of a webpage because it organizes the content that users see when they visit a website.

Overall, I found this laboratory activity helpful because it introduced me to the basic concepts of web development. Although I experienced some difficulties at first, I was able to overcome them by exploring the features of VS Code and learning how to use them properly. This activity helped me become more familiar with writing HTML code and gave me a better understanding of how a simple webpage is created. I realized that learning web development requires patience, practice, and a willingness to solve problems when something does not work as expected.
